The Styx Project

Code of Conduct

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119](#).

The maintainers

- MUST NOT get involved in ANY sort of ARGUMENT, or RESORT TO INSULTS, or use HATEFUL LANGUAGE or any sort of PERSONAL ATTACK, any verbal or non-verbal action that is considered detrimental towards the state of the positive environment of the team.
- MUST upload ALL device sources onto the StyxProject-Devices organization, without any issues whatsoever. It should be pretty clear at this point that they should be FULLY BUILDABLE, and stable for use. Using ANY external repositories aren't allowed, unless they're from a reputed organization. Exceptions are allowed only on discussion with the Board.
- MUST upload a basic changelog for each build on the issue repository. They MUST be user friendly, and you can omit stuff like SafetyNet, kcal or cpuidle changes, but must be understandable to the average user who would like to know what changed since the last update.
- MUST ship the builds WITHOUT fail every month during the first and second week of the month RIGHT after the Board gives the go-ahead for builds. If you cannot personally build, we will be scheduling the build accordingly if we have personal servers/or on our Jenkins instance if available. Exceptions can be made, on personal request to the Board.
- MUST maintain authorship of EVERY git commit that is pushed, this is a mandatory requirement for ALL repositories. Force-pushes are acceptable, but minimize them.
- In the event of ANY disagreement between maintainers, please sort them out via direct messages on Telegram or XDA. Do not take your fights to our chats, do approach the Board if you want something sorted out quickly.
- MUST NOT add ANY features that's extra to Styx Project like ConfigPanel, XiaomiParts, etc.
- Features that are device specific and are available in stock firmware i.e., Alert Slider on OnePlus devices, and MotoActions for Motorola devices, are allowed.
- Dirac Sound is allowed ONLY IF it is present on the STOCK FIRMWARE of the device.
- Google Camera Go or device-specific Google Camera is allowed to be shipped, but please ensure that you use a reliable source and that the device has proper support for it.
- MUST use the SAME device common-tree if a device is already using the same repository. Different branches are not allowed. If the maintainer doesn't want to

use it, then the only option is to completely DECOMMONIZE the device, including vendor and kernel repositories.
- MUST NOT enable AOD if the device has an LCD panel.
- SHOULD follow the kernel guidelines.
- SHOULD have a working proprietary-files listing and extraction script that inherits the global extraction script that is located in tools/extract-utils in their device tree.
- Use only the script generated vendor repositories for the build.
- SE for Android should be ENFORCING, without ignoring any neverallows.
- Builds should be the user variant. We only ship production builds.

IF ANY of these rules are broken, the Board will take direct action against the erring maintainer without prior warning.
